ABSTRACT:

PURPOSE: To separate <u>lactic</u> acid from an immersed solution, by subjecting the immersed solution which is produced as a by-product in preparation of starch by milling maize in a wet state to ultrafiltration, concentrating prepared filtrate to crystallize a <u>lactate</u>.

CONSTITUTION: In a wet milling method wherein maize is immersed in a dilute aqueous solution of sulfurous acid, the immersed solution contains \underline{lactic} acid which is produced by homogenous \underline{lactic} acid $\underline{fermentation}$ of eoluted soluble saccharide with \underline{lactic} acid bacteria. A base is added to the immersed solution, which is adjusted to $5{\sim}12$ PH, $\underline{flocculate}$ and precipitate are removed from the solution, which is subjected to ultrafiltration. The prepared filtrate is concentrated to crystallize a $\underline{lactate}$.
